

Authority Clarification: The 8-Tuple Is Pedagogical Only

The 8-tuple $(Q, \Sigma, L, R, \delta, s, t, r)$ is not a canonical OMI structure, not an authority layer, not a proof object, and not the extended Hamming $[8,4,4]$ code itself.

The 8-tuple is a pedagogical bridge.

It is used only to help readers understand why Omicron and Omnicron require a readable relation hinge such as:

```
omi---imo?O_o
```

The extended Hamming $[8,4,4]$ code remains the finite binary reference surface: length 8, rank 4, minimum distance 4, and 16 codewords. The 8-tuple gives one explanatory way to name an 8-position computational surface over that code, but it does not define the code and must not be carried forward as a canonical equivalence.

The correct status assignment is:

```
Extended Hamming [8,4,4]:  
  proved / standard mathematics  
  
8-tuple (Q,  $\Sigma$ , L, R,  $\delta$ , s, t, r):  
  pedagogical coordinate example  
  
Omicron:  
  deterministic normalization and closure surface  
  
Omnicron:  
  resolver/projection surface  
  
omi---imo?O_o:  
  readable relation hinge
```

Therefore, all future OMI documents must avoid the statement:

```
The 8-tuple is the Hamming code.
```

The approved statement is:

The 8-tuple is a pedagogical coordinate surface used to explain how an 8-position computational view can be placed over the extended Hamming [8,4,4] code.

Likewise, future documents must avoid implying that the 8-tuple proves, constructs, or authorizes E8, Omicron, Omnicron, or `omi---imo?0_o`.

The approved carry-forward claim is:

The extended Hamming [8,4,4] code provides a finite binary doorway into the E8 construction. The 8-tuple is only an explanatory naming scaffold over that doorway, used to clarify the Omicron/Omicron reason for projecting the relation as `omi---imo?0_o`.

This clarification supersedes any earlier phrasing that identifies the 8-tuple itself with Hamming [8,4,4], E8, or an OMI authority layer.
